Data Marshal Analyzer

Data Marshal Analyzer assists with capturing data to plan and project archive or tier eligible data.

Using end-user data access patterns, learn about the data in your environment and optimize your business storage tiering and archiving needs!

What It Does

Data Marshal Analyzer provides a percentage of data which is ready for archiving and identifies archive eligible data based on user access patterns (last modified, last accessed, etc.). Use it to identify file count growth and extrapolate information to predict growth rate of archive eligible data allowing you to predict Isilon storage growth over time.

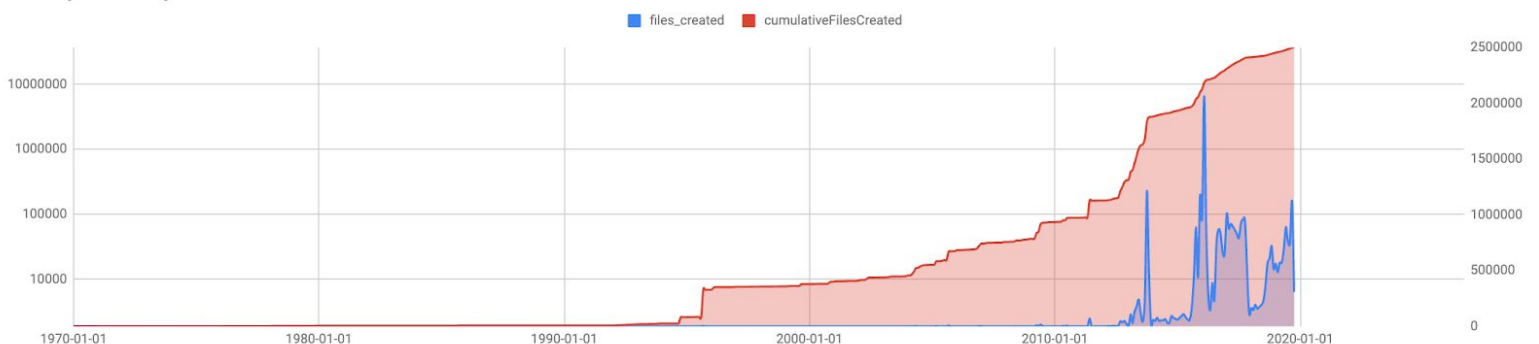

What You Get

- **Data Tiering Strategy:** identify how much data can be tiered and archived.
- **Recover Capacity:** identify inactive files which can be placed on lower cost storage and reclaim space on Isilon.

How Do We Help

- Deploy a VM with small footprint -- runs on a laptop!
- Run the Data Marshal Analyzer tool
- Superna consultant will provide summary analysis including percentage of data which can be archived and recommendations for data tiering and archiving!

History - Monthly Files Created
